

Task 1:

The image shows two screenshots of a Kali Linux virtual machine running Oracle VM VirtualBox. The top screenshot displays the DVWA (Damn Vulnerable Web Application) login page. The page features the DVWA logo, a username input field, a password input field, and a 'Login' button. A FoxyProxy extension window is open on the right side of the browser, showing options to 'Disable' or 'Enable' the proxy, and a 'BurpSuite' button. The bottom screenshot shows the DVWA Security page. The page has a sidebar menu with links to Home, Instructions, Setup, Brute Force, Command Execution, CSRF, File Inclusion, SQL Injection, SQL Injection (Blind), Upload, XSS reflected, XSS stored, DVWA Security (highlighted), PHP Info, About, and Logout. The main content area is titled 'DVWA Security' and contains sections for 'Script Security' and 'PHPIDS'. The 'Script Security' section indicates that the security level is currently high and provides a dropdown menu to set the level to low, medium, or high, with a 'Submit' button. The 'PHPIDS' section provides information about the PHP-Intrusion Detection System (PHPIDS) and includes links to enable it, simulate an attack, and view the log.

Script Security

Security Level is currently high.

You can set the security level to low, medium or high.

The security level changes the vulnerability level of DVWA.

low Submit

PHPIDS

PHPIDS v.0.6 (PHP-Intrusion Detection System) is a security layer for PHP based web applications.

You can enable PHPIDS across this site for the duration of your session.

PHPIDS is currently disabled. [enable PHPIDS](#)
